

N-G000 NK 18-00-24

NITROGEN COMPOUND FERTILIZERS WITH DCD NITRIFICATION INHIBITOR OBTAINED BY PHYSICAL COMPACTION

The N-G000 LINE is the range of slow-release granular nitrogen fertilizers, containing the nitrification inhibitor Dicyandiamide (DCD). The presence of DCD, which inhibits the activity of the Nitrosomonas bacteria responsible for the nitrification process, allows the gradual transformation of ammoniacal nitrogen, absorbed by soil colloids and non-washable into the nitric form, highly washable, in a period of time between 60 and 90 days. Throughout this period, nitrogen is made available to the plants gradually, reducing losses both by leaching into the soil and by volatilization in the atmosphere. This allows a dose reduction of up to 20% in fertilizing units, compared to traditional formulations.

The granular formulation of these fertilizers is obtained through compaction, a dry granulation process borrowed from the pharmaceutical industry that uses mechanical compression to agglomerate the particles of the raw materials. This allows for granules to be obtained without adding solvents, which can have a negative impact on the final solubility of the product. The granule obtained by compaction is characterized by easy and fast disintegration, ensuring a rapid assimilation of nutrients by the roots.

The efficacy of the product is also improved by the particular production process in which DCD in the microcrystalline state is mixed with the other raw materials (Nitrogen, Phosphorus, Potassium) and everything is subsequently compacted. This allows to ensure the uniform distribution of the inhibitor in the granule, improving its effectiveness and efficiency both in nutritional and environmental terms.

N-G000 NK 18-00-24 is a binary fertilizer (NK) of the N-G000 LINE with an important sulfur content that improves production quality by directly intervening on the synthesis of sulfur amino acids. Its strong acidifying effect on the rhizosphere also favors nutrient absorption, thus improving plant development. The considerable presence of potassium then promotes the fruit ripening process, enhancing color, flavor and aroma. In addition potassium contributes to tissue strengthening, enhancing natural defences against pathogen attacks and increasing fruit mechanical strength. N-G000 NK 18-00-24 is recommended in the fruit growing phase on both horticultural and fruit crops.

CROP	TIME OF APPLICATION	DOSE/HECTARE*
Fruit crops e Horticultural crops e Cereal crops	Pre-transplanting/sowing fertilization, Post-transplanting/sowing fertilization	400-600 kg

COMPOSITION	
Total nitrogen (N)	18.00%
Ammoniacal nitrogen (N)	7.50%
Ureic nitrogen (N)	10.50%
Nitrogen inhibitor Dicyandiamide (DCD)	2.50%
Inhibitor content as a mass percentage of the total nitrogen	2.50%
Potassium oxide (K ₂ O) total	24.00%
Potassium oxide (K ₂ O) soluble in water	24.00%
Sulfuric anhydride (SO ₃) soluble in water	20.00%

PHYSICO-CHEMICAL FEATURES			
GRANULAR			
METHOD OF USE			
	Cover fertilization	Pre-sowing fertilization	Fertilizers for bush transplanting

PACKAGING: 25 KG - PALLET 1500 KG, BIG BAG 600 KG
